

Access Control in Offices

Overcoming your on-site challenges

Your Challenge	Our Solutions	Your Benefits
Mixed user types: you need to accommodate staff, visitors, contractors, and other users	• ATRIUM offers up to 1,000 different access levels to customise permissions across a wide range of requirements. • Choose from card, tag, PIN, biometric, or smartphone credentials to suit the needs of the business & the user.	Take control over admin with simplified management of users, and accurately control who has access to which areas.
High traffic during shift change times with peak areas like the lobby	• The scalable configuration of ATRIUM makes it easy to add and remove users as needed. • Readers identify and authenticate users quickly when credentials are presented.	Smoother flows of traffic with fewer bottleneck problems and a more efficient start and end to shifts. Plus a more professional appearance for visitors.
After-hours access and remote workers visiting infrequently or irregularly	• Up to 250 time zone schedules in ATRIUM mean access permissions can be customised differently for different days of the week or times of the day.	Ensures the building is secure but accessible by authorised individuals at all times, as well as supporting flexible working patterns and hybrid working.
Siloed building systems like elevators and parking	• Off-the-shelf integrations in ATRIUM include elevators, intruder alarms, CCTV and ANPR.	Integrated and efficient building management systems that work together to optimise security.
Need to keep disruption to a minimum to reduce impact on business operations	• 2 doors supported by every ATRIUM controller means installations are quicker and less disruptive. • The modular nature of ATRIUM enables phased installations, rolled out across a building over time.	The initial installation is quicker, cheaper, and has less impact on BAU operations. There's minimised downtime so building security isn't compromised.
Staff turnover and contractor changes	• Access levels and user profiles are quick and easy to update. With port forwarding technology, simple changes can be made from anywhere, on any internet-connected device. • Desktop enrolment readers for ATRIUM for registering new users without the need to interrupt live readers.	Fast and efficient management, plus with remote browser login, quicker response to security breach risks like lost cards/tags.
Sensitive areas such as server rooms, data centres, or document archives	• AES encryption from end to end in the ATRIUM KRYPTO system. • Simple integration of iuvo fingerprint readers for even higher security.	Card cloning is rendered impossible by the AES encryption, and fingerprints are extremely unlikely to be accurately cloned, so you can be certain that only authorised individuals can gain access to sensitive areas.

Need to manage and monitor building occupancy for safety and compliance reasons	• ATRIUM controllers are equipped with a built-in counter function for tracking people entering and exiting rooms. • Real-time door status tracking and simple floorplan view in the ATRIUM software.	Improved emergency responses and regulatory compliance with accurate access records. Plus, audit logs for investigating security incidents effectively.
Data security and privacy	• AES encryption from end to end in the ATRIUM KRYPTO system.	Card cloning is rendered impossible by the AES encryption, and data is kept securely, improving users' buy-in and confidence in the system.
Heavy glass or fire doors that are difficult for staff and visitors to open	• DIGIWAY automatic door operators either push or pull doors when triggered by a push-button or an input from an access control system.	Better accessibility and user comfort for everybody, especially wheelchair users and less mobile individuals.
Difficulty opening doors when carrying laptops or other items	• Touch-free options for triggering automatic doors via ATRIUM, with infrared buttons and facial recognition.	Better convenience for users, improved health & safety practices, and better hygiene with reduced physical touchpoints.
Emergency response planning to ensure swift and safe escape routes	• Instant lockdown function in ATRIUM triggers every door to either lock or unlock – depending on the need – in an emergency situation.	Faster and safer evacuation during emergencies, plus safe room clearance procedures for emergency services.
